	6.1 Forest Profile	37
	6.2 Agriculture profile	39
	6.3 Horticulture profile	41
7	Details of Mining Lease in the District	42
	9.1 List of Operational sources	Ann- II (A)
	9.2 List of Non-operational sources	Ann- II (B)
	9.3 List of New sources	Ann- II (C)

8	Detail of Royalty	43
9	Detail of production in last 5 years	44
10	Mineral Map of the District.	44
11	List of Letter of Intent (LOI) holders in the district along with its Validity.	45
12	Total Mineral Reserve available in the district.	45
13	Quality/Grade of Mineral available in the district.	45
14	Use of Mineral.	45
15	Demand and Supply of the Mineral in the Last Three Years.	45
16	Map of Existing Mining Leases in the District.	Plate-I
17	Details of the Area of where there is a cluster of mining lease viz. Number of mining leases, location (latitude and longitude).	Ann-III
18	Details of Eco-Sensitive Area, if Any, In the District	46
19	Current per capita power consumption per month/annum	46
20	Impact of Mining on Environment	46
21	Remedial Measures to Mitigate the Impact of Mining on the Environment	49
22	Reclamation of Mined Out Area	51
23	Risk Assessment and Disaster Management Plan	51
24	General responsibilities of employees' during an emergency	52
25	Details of the Occupational Health Issue in the District	52
26	Plantation and Green Belt Development in Respect of Lease Already Granted in the District	53
27	Conclusion	54
28	Details of Sand/M-Sand Sources	Annexure-I
29	List of Potential Mining Leases (existing & proposed)	Annexure-II
30	List of Cluster & Contiguous Cluster	Annexure-III
31	Transportation Routes for individual Leases and Leases in Cluster	Annexure-IV

PREAMBLE

Odisha is renowned for its rich mineral resources, with a diverse array of both major and minor minerals found throughout the state. Among its distinctive regions, the Koraput district stands out, located in the southernmost part of Odisha. This district boasts a unique geological profile and is abundant in various mineral resources, contributing significantly to the state's overall mineral wealth.

In pursuance of the order of Hon'ble Supreme Court Petition (C) No. 19628-19629 of 2009, dated 27th Feb. 2012 in the matter of Deepak Kumar Vs State of Haryana and others etc., prior Environmental Clearance has now become mandatory for mining of Minor Mineral irrespective of the area of Mining Lease. And also, in view of the Hon'ble National Green Tribunal, order dated the 13th Jan. 2015 the matter regarding Sand, Brick Earth, & Burrowed Earth cutting for Road Construction has to take prior E.C. for Mining Lease area more or less than 5 hectares also suggested making a policy on E.C for Minor Mineral lease in cluster.

Further, as per notification issued by the Ministry of Environment & Forest and Climate Change (MoEF & CC); Notification no. S.O.3611 (E) New Delhi dated 25-07-2018, the District Survey Report (DSR) for Minor minerals of Koraput District on Sand sources has been prepared in accordance with Clause II of Appendix- X of the notification and the procedure and annexure as per MoEF & CC Enforcement and monitoring guidelines of January, 2020.

District Survey Reports (DSR) pertains to the district's demographic profile, mineral wealth, geology, forest, climate, rainfall data, health, agriculture and irrigation pattern in the Koraput. This Report act as a compendium of available adequate mineral resources, geological set up, environmental protection, ecological set up, community engagement and regulatory compliance of the district. Various data available from the state government departments like Revenue, Agriculture and Horticulture, Forest, Geology and Mining, Water Resource, Health, R & B, RWSS and NHAI in the district, as well as statistical data has been incorporated within the DSR. The main purpose for the preparation of DSR (as per the Sustainable Mining Guidelines) is to identify the mineral resources and develop the mining activities in the district as to form the basis for the **Environmental Clearance (EC)** along with other relevant data. District Survey Reports are to be reviewed once in every five years as per statue. The Main objective of the preparation of District Survey Report is to ensure the Mineral Resources in the district having the potentiality where mining can be allowed and find out the areas where mining should be prohibited.

Endeavour has made to cover potential area for Sand sources in the district to include in the DSR, overview the Sand mining activities in the district measures has been taken to ease the gap between the demand and supply of the raw material, including the planning, monitoring of mined material and its transport and to curb illegal mining & sales of material. Keeping in view of the orders of Hon'ble Supreme Court, Hon'ble NGT and directions of SEIAA, Bhubaneswar a fresh DSR has been prepared, adhering to all necessary formalities. This updated DSR is set to be finalized in December 2024.

CHAPTER-I

INTRODUCTION

1.1 GENERAL INFORMATION:

Koraput district located in the backdrop of green valley's contemplating immaculate freshness which lies along the southern flank of the Odisha State in a section of the Eastern Ghats. The district is often referred to as the Emerald Highlands of Odisha, the Switzerland of Odisha, or the Heaven of Odisha.

District draws its attraction for tourists from all over the world for its nature and indigenous tribes. Decorated forest, waterfall, terraced valley, spring and lush vegetation attract many nature-loving people to the area. Present-day Koraput has Odisha's highest peak at Deomali (1672 m). It is also the site of the Duduma Waterfalls (540 ft) as well as the major hydroelectric and irrigation projects of Kolab, Muran, Telengiri and Jolaput. The HAL establishment at Sunabeda manufactures Sukhoi engines, while the NALCO mines at Panchapatmali is Asia's largest bauxite mines. Koraput is also known for the GI-tagged Kotpad fabrics, the famous Shiva temple at Gupteshwar, the well-known Koraput tribal coffee, and the yearlong production of various fruits and vegetables. Its mild climate, frequent rainfall, vibrant tribal culture and natural beauty have made it a hub for tourism. Koraput is one of the mineral rich districts, stands for its bauxite, limestone, manganese etc. in the area also it is an agricultural district mainly dependent on its product, with 301,000 hectares of cultivable land. The "Rice Bowl of Odisha" refers to the districts of Odisha, India, known for their high rice production. These districts are i.e. Sambalpur, Bolangir, Bargarh, Subarnapur, Nuapada, Kalahandi, Nabarangpur and Koraput. which are fertile and irrigated by various rivers, making them suitable for rice cultivation in the state. The district is also known for its village and cottage industries.

Koraput is a part of the tribal belt in southern Odisha, manifests the heartland of the tribal community in state, more than half of the population are tribal communities such as the Paraja, Gadaba, and Kandha, etc.

Geographically, It's the third largest district in Odisha by area, covering 8,807 sq.km. As of 2023, the district had a population of 16.13 lakhs making it the 15th most

populated district in the state represents sex ratio is 1032. District with its Headquarter at Koraput town, 2 sub-divisions, 14 blocks/Tahasil, 26 Police Stations, 240 Panchayats and 2042 villages

1.2 HISTORY OF THE DISTRICT

The history of the district dates back to the 3rd century BC when it was part of the valiant and formidable Atavika Rajyas, referring to the tribal people who inhabited the forests. Legendary Dandakaranya/Dandaka Forest has been lavishly described in the famous Indian Epic “Ramayan”. The area was a part of the kingdoms of various dynasties like Satavahans, Ikshvakus, Nalas, Ganga and Suryavanshi kings. Owing to its geographic isolation and thick forests, there was no permanent presence of ruling dynasties beyond small outposts. Vinayak Deo, the founder of the present Jeypore Raj family, inherited the kingdom from the Silavamsis by the middle of the 15th century A.D. It is said that this Kingdom then extended up to Budalinga of Kalahandi district in the North, up to Kambamottu in the present Malkangiri district in the South, up to Bhaskar River in the present Nabarangpur district in the West and up to the coastal plains in the East. The capital of the Kingdom was at Nandapur which had been founded by the Silavamsis. This kingdom, however, lost its independence in 1571A.D. and became a feudatory of the Qutub Shahis of Golkonda. The Nandapur kings started paying annual tribute to the Sultans. During the time of Viravikrama Deo, who ruled in the middle of the 17th Century A.D., the amount of such annual tribute was Rs. 24,000. During the rule of Sri Biswambhara Deo, I (1672-1676) and his successor Sri Mallaki Mardana Krishna (1676 -1681) a number of feudal estates were created which in course of time assumed independence. During the time of Balaram Deo III (1711 -1713) large number of zamindars and feudatories seceded from the Jeypore Kingdom with the help of the Marathas. Viziamam Raju of Vizianagaram took away a large slice of coastal territory with the help of Jafar Ali Khan, the Fouzdar of Chicacole, during the reign of Biswambhara Deo II (1713-1752). In 1768 the descendants of Viziamam Raju claimed Kashipuram, Nandapur, Madgol etc., under an alleged patta of Salabat Jang and they were supported by the East India Company. Vikram Deo I, the then ruler, held back those territories in lieu of an annual rent of Rs. 40, 000 of which no more than three-fourths were ever paid. It was during the rule of Vikram Deo II that the capital of the kingdom was finally transferred to Jeypore. Lying on the trade route linking Central India with the coast.

Koraput was a center of Jain culture till around the thirteenth century. The entire area then came under the rule of the Suryavanshi dynasty based first at Nandapur, then Narayanapatna and finally at Jeypore. Known as the Jeypore Rajas, this dynasty received allegiance from a number of autonomous feudal estates before being subjugated by the British in the late 18th century. Direct British rule was established in the mid-19th century and the Raja of Jeypore became one of the largest Zamindars of the Madras Presidency. The entire estate became a part of the Visakhapatnam District.

Though Lord Clive obtained in 1765 from the Mughal Emperor a Firman granting the Northern Sircars to the Company and four years later Vizagapatnam was made the headquarters of the district a century elapsed before the British Government assumed the direct administration of Jeypore territory. At that time the whole of modern Koraput district was not directly under the control of the Rajas of Jeypore. There were a number of semi-independent chiefs like the zamindar of Pachipenta and Raja of Bissam-Cuttack who were administering their own territories without having any concern with the Jeypore kings. The Kotpad Pargana and the Salimi Mutta were parts of Bastar till 1777 and 1828 A.D. respectively. This state of affairs continued till 1862 A.D. and on 1st January, 1863 A.D. British Government appointed an Assistant Agent at Jeypore with jurisdiction over the present Malkangiri, Nabarangpur and Koraput (except Narayanapatna P.S.) sub-divisions. Another Assistant Agent at Parvatipuram with jurisdiction over Narayanapatna police station and Rayagada and Gunupur subdivisions was also appointed under the Collector of Vizagapatnam for the administration of civil and criminal justice. From the time of assumption of administration by the British Government no perceptible change occurred in the territorial limits of the Jeypore estate till the time of Vikram Deo III (1889-1920). This ruler purchased the Pachipenta estate for six lakhs of rupees and thus the boundary of Jeypore extended down to the Ghat near Itikavalasa. In 1920 he also acquired a portion of the Madgol estate by purchase and the other portion was later on acquired by his son Rama Chandra Deo by relinquishment in the year 1928 A.D. The district of Vizagapatnam, like those of Ganjam and East Godavari districts, was divided into two sharply distinct portions, namely, the Plains and the Agency. Due to some administrative difficulties, T. Harris, Agent to the Governor in Vizagapatnam district strongly urged the Government of Madras to form a single administrative division of the Agencies in the three districts. His plan was approved

and in 1920, all the Agency tracts were removed from the control of Collectors and were placed under the charge of a commissioner who had his headquarters at Waltair. The administrative subdivisions were distributed as far as possible on linguistic lines overriding the former district boundaries. The present Koraput district was parceled out among four subdivisions called Kondh, Savara, Odia and Ghats each in charge of an Officer, designated as Assistant Commissioner. Due to some practical difficulties, lack of accommodation and financial stringency, the experiment had to be abandoned in 1923. The office of the Commissioner was abolished and the old arrangements were restored. No further changes of importance were made until the formation of Odisha Province in 1936 when Koraput district was created and a number of changes were found necessary. The Parlakimedi taluk was included in the district for seven months after which it was again restored to Ganjam. Koraput District was carved out as Odia speaking parts of the old Visakhapatnam District on 1st April, 1936 and became a part of the new state of Odisha on the same day. Regionally, the area is well known for part of Koraput-Balangir-Kalahandi districts (KBK districts). In the beginning when Koraput district (undivided) was constituted after formation of Odisha province in 1936, where Kashipur was not a part of Koraput. The whole of the district of erstwhile larger Koraput comprises the estates of Jeypore and Kashipur zamindari of erstwhile Kalahandi princely state. After independence when Kalahandi district was formed, Kashipur continued to be its part till 1962 and in the same year it was taken out of Kalahandi district and made a part of Koraput district as a Tahasil. The district is now in charge of a District Magistrate and Collector with headquarters at Koraput. There were, at the beginning, two subdivisions Rayagada and Koraput. Koraput subdivision comprised five taluks namely, Koraput, Pottangi, Jeypore, Nabarangpur and Malkangiri. On 1st March, 1941 a new subdivision called Nabarangpur subdivision consisting of the taluks of Malkangiri, Jeypore and Nabarangpur was created. The taluks of Koraput and Pottangi were abolished and the Narayanapatna Agency which was separated from Rayagada Taluk constituted the new Koraput subdivision. The arrangement of three subdivisions continued till 1962 although meanwhile some new taluks or tahasils were created. Subsequently Malkangiri and Jeypore sub-divisions were created. In 1992, Koraput was divided into four districts. Present Koraput district has now two subdivisions with the Tahsils under the Koraput Sub-Division: Koraput, Nandapur, Machhkund, Pottangi, Semiliguda Bandhugaon, Narayanapatna, Laxmipur and Dasamantpur, while under Jeypore Sub-Division: Borigumma,

Jeypore, Kotpad, Kundra and Boipariguda. The fourteen Tahasils are co-terminus with fourteen Blocks vide Notification No. 17662, Dated 19.04.2008 and No. 33533 / R &DM, Dated 06.08.2008 of the Government in Revenue and Disaster Management Department Government of Odisha. There are 26 Police Stations in the district.

1.3 ORIGIN OF THE NAME

According to Mr. R.C.S. Bell, the name of the town is “Kora-Putti” or the hamlet of the Nux-vomical and it is derived presumably from Kora that must at one time have been prominent near the site. Some opine that the word is derived from KHORA a sect of people who still inhabit nearby villages.

According to the second theory, Koraput is a corrupted form of Karaka- Pentho‘. Karaka literally means hail-stone‘. Another opinion is often found that the term Kora that means the Sun God who was worshipped by the local tribals in ancient times. Hence the town was so named.

1.4 LOCATION AND GENERAL BOUNDARIES

Koraput, one of the southern districts of the state bounded by Rayagada District and Parvatipuram-Manyam District (A.P) towards the north-east, on the extreme North bounded by Nabarangpur District, on north-west by Bastar District (C.G) and by Malkangiri District, Vizianagaram & Srikakulam Districts (A.P) towards the south. It lies between the meridians of 18.13° to 19.10° degree North latitude and parallels of 82.5° to 83.23° degree east longitude. Koraput is about 500km from Bhubaneswar and 200km from Visakhapatnam by road. It can also be reached by direct trains from Howrah, Bhubaneswar, Sambalpur and Visakhapatnam. Apart from these parts of Kirundal- Kotavasla and Koraput- Rayagada rail links of Indian railway provides railway communication facility within the district. The airport at Jeypore is connected by daily flights to Bhubaneswar and Visakhapatnam.

1.5 ADMINISTRATIVE SET UPS

To ensure better administrative control, Koraput district has been divided into two sub-divisions: Koraput and Jeypore, encompassing a total of 14 Tahasil/ blocks. This initiative reflects a commitment to decentralization and empowers local leaders to address the unique challenges faced by their areas.

Table-1

Suv-Division	SL no	Tahasil/ Blocks
Koraput sub-division	1	Koraput

11	Villages	Numbers	2042
	Inhabited	Numbers	1941
	Uninhabited	Numbers	101
12	Assembly constituencies	Numbers	5

1.6 TRANSPORT & COMMUNICATION

The district is well connected with road and railway infrastructure including National Highways (NH-26, NH-326 and NH-201), State Highways (SH-4, SH-10, SH-25 & SH-48), major district roads and classified village road etc. It also has railway connectivity to Vishakhapatnam, Rayagada, and Jagadapur cities. The Jeypore airport has facilitated airway communication. The proposed gala structure of Bharatmala route connecting Raipur-Vishakhapatnam and Jeypore-Malkangiri Railway project are potential future communication options to the district.

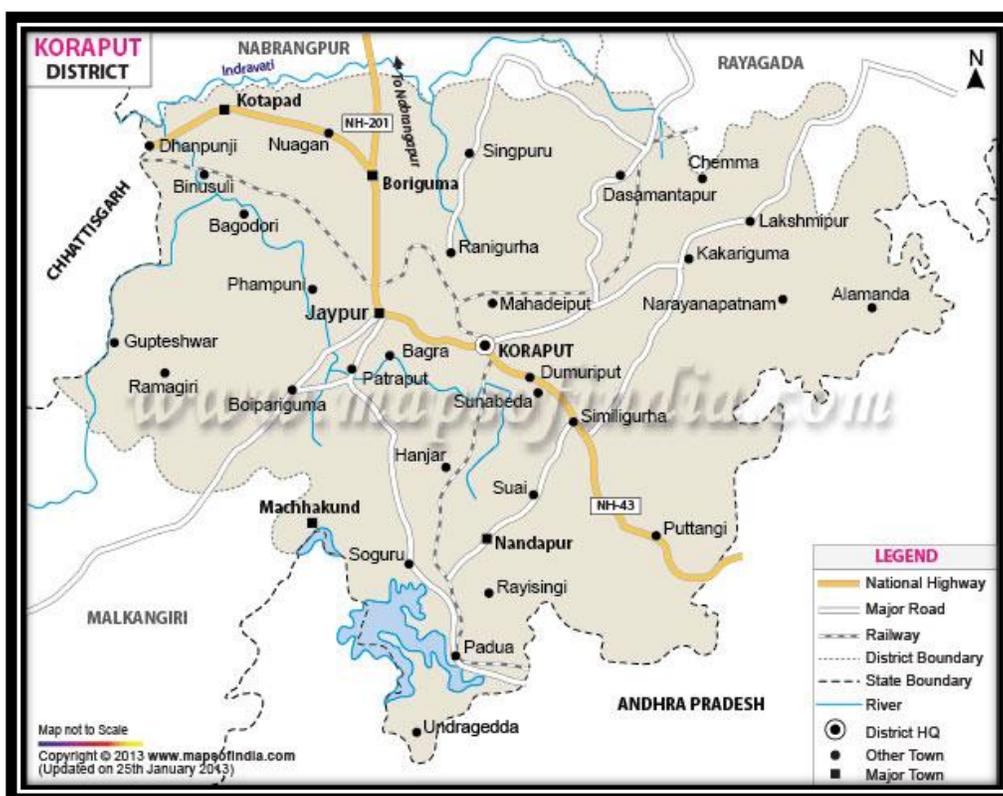

Table-3

Communication	Distance
Railway route length in km	240 km
No. of Railway stations and PH	23 no.
Forest road	208.75 km
Bharatmala	116.33km
National Highway	404.50 km

CHAPTER-II

OVERVIEW OF MINING ACTIVITIES IN THE DISTRICT

Koraput district is endowed with rich source of bauxite, limestone, china-clay and decorative stones etc, where natural resources contribute to state Exchequer and supports in industrial progress of the state. The major bauxite mines are located in the plateau of Panchapatmali, Pottangi and Mali Parbat where mining operators are NALCO (a central govt. PSU), OMC (a state govt. PSU) and Hindalco (a giant private mining company) respectively. For limestone mines lease are located in Ampavalley operated by OMC (a state govt. PSU). Apart from this, there are quite a few mines for specified minor minerals (decorative stone) in operation. Further, minor minerals like river sand and road metal occurrences are also being used in different developmental work in the district.

The following table gives the list of working Mineral mines and name of mines given for which letter of Intent has been given for execution of mines in Koraput district.

Table-4

Sl. No.	Location of the Mining Lease	Name of the Lease	Name of the Mineral	Validity		F.Y. 2023-24			Remarks.
				From	To	Collection of Royalty (Rs.)	Collection of Other Revenue (DR/SR) (Rs.)	Production (M.T)

12	Karnaparhikonda	-	Bauxite	-	-	0.00	0.00	0.000	Under process for verification of land schedule for auction.

Further, Koraput District is self-sufficient in its minor mineral resources, including stone (road metal), sand, murrom, and ordinary earth. The district boasts a total of 267 minor mineral sources, with 125 currently in operation. This includes 85 stone sources, 31 sand sources, and 9 murrom sources. The abundant availability of these resources supports local infrastructure development and contributes to the district's economic sustainability.

CHAPTER-III

GENERAL PROFILE OF THE DISTRICT

3.1 GEOGRAPHY OF THE DISTRICT

Koraput district covers a total area of 8,807 sq.km. The district lies between 18.13° to 19.10° north latitude and 82.5° to 82.23° east longitude. The Confluence Point in Koraput District is near the village of Maligam under Dashmantpur Police station in Laxmipur Block. It is about 25km from Koraput. Confluence means meeting of longitude and latitude of earth. The exact point is in the middle of the Muran River (a tributary of the Indravati River), which flows its way among the small hills. The Point has been clearly marked on the Survey of India Topo-Sheet No 65J/13, by the banks of the river. It is 19.00.000 N 83.00.000 E. However, the Confluence Point lies center in the middle of the river. The old 1942 Survey of India map sheet could not give the exact location on the ground as the river had altered its course by at least 30m since the survey. The only way to reach the Point was to wade through the thigh deep water. Anil Dhir, a journalist and Kashinath Sahu located this point in 2014.

The whole district can be divided into two geographical divisions each of which can be separated by natural barriers as their respective limits with undulated Koraput sub-division and plain Jeypore sub-division. The portion of plateau which lies in the Koraput district consists of an undulating table land profusely scattered with hundreds of little hills of remarkable similarity in appearance. This plateau is really a rare gift of nature for its scenic beauty. The process of denudation has advanced too far and the hills are either covered with low scrub or disfigured with patches barred by shifting cultivation. In case of Jeypore Sub-division which is more or less plain with few hillocks, with their lower order tributary nalas arranged in a sub dendritic pattern control over all drainage pattern of the district.

3.2 DEMOGRAPHY

As per 2011 census, the total population of the district is 13,79,647 consisting of 2042 villages. Urban Population is 2,26,169 and rural population is 11,53,478. Total male

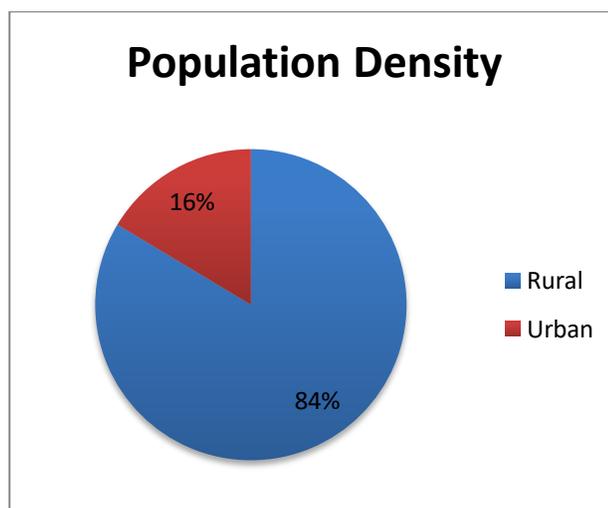

population of the district is 6,78,809 and female population is 7,00, 838. The average literacy rate of the district is 49.2% comprising 60.3% male and 38.6% female literacy rate.

Table-5

Name	Area in sq.km.	Remarks
Geographical Area	8807	21.34% of area of the district is covered under the forest
Area under Forest	1879.53	

Table-6

Population 2011 Census

Scheduled Tribe	697583	50.56
Scheduled Tribe male	337373	48.36
Scheduled Tribe Female	360210	51.64

3.3 HILL SYSTEM

This district lies on a section of the Eastern Ghats and consists of two natural divisions having mean elevations of 915m and 610m respectively above the sea level. There are number of mountain ranges and isolated hills that rise out as table lands. Taking them in order from north to south the most notable heights are Panchapat Mali (1336.89m), Karnapadi Dongar (1487.5m) Meyamali Parbat (1500.30m) Turia Dongar (1598.78 m), Deomali (1672.56m), Polamakani Parbat (1585.67m) and Sirimanda Parbat or Damuku (1415.24m). The village Pottangi lies at the foot of the last named Damuku. Deomali, also known as Duhdari, whose twin peaks can be clearly seen from Koraput on any fine day, is the highest mountain peak in the district as also in the whole of Odisha.

In Jeypore sub-division there are low hills, some of which rise to 793m. Elsewhere, the plain is only broken by isolated hills, among which those near Podagada (930m), Borigumma (916m) and Boipariguda (927m) may be mentioned.

3.4 RIVER SYSTEM

The district has many rivers and perennial streams. River deposits refer to the sedimentary materials transported and deposited by rivers. These deposits are crucial for understanding geological history, river dynamics, and environmental processes in the district. Almost the entire Koraput district is drained by four rivers namely the Indravati, the Kolab, the Machhkund and the Champabati or Jhanjabati, with their tributaries. These rivers flow inland westward and the southward into the valley of the Godavari.

- **Indrāvati River:** The Indravati River in Odisha is a significant river in eastern India. The Indravati starts from the forest land of the Eastern Ghats' Thuamul Rampur hills in Kalahandi district and after receiving a number of perennial hill streams, rising in Kashipur Tahsil and Nabarangpur and Koraput sub-divisions, it enters Bastar after flowing through Nabarangpur district and Kotpad Tahasil of Koraput. The Bhaskel joins it just before it leaves Koraput District. On its Course forms the beautiful Chitrakota falls about 40km west of Jagadapur in Bastar district of Chattishgarh. The total length is 526kms, of which 123kms run through Koraput district or along its boundary. River joins the Godavari River at Dumbriguda, Andhra Pradesh. Major tributaries of the rivers

are Nakti, Soin, and Tel rivers. River has provided a mega-structure form the Indravati Dam and reservoir in its course, supports irrigation and agriculture, Hydro-electric power generation, Rich biodiversity and ecosystem.

- **Kolab River:** The Kolab rises near Sinkaram hill range on the 915m plateau, flows northwest in a winding bed, passing 8 km to the south of Koraput and falls down to the 610m plateau not far south of Jeypore. At Bagara, to which a branch road leads from the top of the Jeypore Ghat there are three small falls whose potentialities as sources of hydro-electric power were investigated in the thirties of the last century. At present hydroelectricity is produced after the installation of a hydro power plant at the foot of the hill to the side of Jeypore town which is functioning since 10.03.1988. At the end of it's decent to the Jeypore plateau the river is spanned by a fine bridge near Kotta. It flows right across the Jeypore tahsil in a north-west direction for 32km to 48km and then suddenly run nearly south, forming the boundary between Koraput and Bastar. It then runs south back into this district forming, for a few km, the boundary between Nabarangpur and Malkangiri districts passing at this point through a gorge in the wild hills to the west of Ramagiri, which are called Tulisi Dongar range. As it issues from this it falls about 15m into a large pool, 4 or 5m deep, into which in days gone by, as tradition goes, witches used to be thrown with a stone round their neck. Turning west again, and passing Salimi, the river flows into Bastar past Sukuma, and at last again divides Bastar from Koraput, forming the western boundary of Malkangiri subdivision for many kilometers. In the last part of its course, it is called the Sabari or Saberi. At Motu the extreme south-western corner of Malkangiri district it meets the Sileru to pass out of Odisha into Andhra Pradesh and falls eventually into the river Godavari. The total length of the Kolab-Sabari is 448km, of which 88km flow through and along its boundary of the district.
- **Machhkund River:** The Machhkund rises in the Madgol hills of Visakhapatnam district on the 915meters plateau, and near Wondragedda, not many miles off its sources; it becomes the boundary between Andhra Pradesh and Odisha. For around 48km the river runs nearly northward along a very meandering course through the wide Padwa valley. Five km from the bend, about the same distance south of Badigada the descent is barred by a huge barrier of rock shut in on either side by walls of rock two or three hundred feet in height. Below this is a sheer abyss over which the river used to

fling itself into a boiling pool half hidden by dense clouds of spray, on which the sunlight used to throw the brightest of rainbows. In the dry season it was possible to scramble to the edge of the abyss and look straight down through the spray into the great pool beneath, while from beneath the scene was the most impressive, inspiring a mixed sense of awe and beauty in the minds of the visitors. But, with the diversion of the stream and installation of the Machhkund Hydro-electric Project that beautiful sight is no more to be seen. These falls, with a 165m drop, are known by the name Duduma falls presumably in the absence of an adjacent village to name them after, as the word Duduma' itself means Waterfall. Below the falls for 5 or 6 km the river flows towards the south-west in a deep and a gloomy gorge, hemmed in on both sides by rock walls seven or eight hundred feet high into which it is impossible to descend except by the winch or the flight of steps of the Machhkund Project. The river flows down this narrow valley shut in by high hills till it reaches Kondakamberu (Malkangiri district) 67km from Badigada. This valley of the Machhkund is the most inaccessible and the least populated region in the whole district. On the way one meets a small village of primitive tribes named Didayis, who are not found anywhere but, in this valley, while at one point the path runs through dense forests for twenty-four km without any sight of human habitation. The surrounding forests used to serve as admirable abode of wild life and even in the middle of summer there is a broad stream in the river some 0.70meter deep. It would be possible to make the whole journey from the falls to Kondakamberu in a dugout canoe at any time of the year. At Kondakamberu (427meters above sea-level) the river is some 7.31meters wide and unaffordable at all seasons. It is now joined by a large tributary, the Gurupriya, which rises in the high hills of Madgol and flows entirely through forest down a steep and rocky course. A few miles beyond Kondakamberu the river assumes the name Sileru (Rocky stream) and once again becomes the boundary of the State, separating it this time from the East Godavari district of Andhra Pradesh. It flows by a much steeper gradient than before; abounding in Mahaseer (a rare type of game fish) and crocodiles until at Motu it joints Sabari. Nothing can excel the supreme beauty of this lonely river, with its bamboo-covered banks, its deep long reaches of water, it falls, its grass-covered islets and its rushing clear water. Its length is 294kms, of which there is a 61km flow through this district and 192kms along its boundaries.

- **Champabati River /Jhanjabati River:** The river Champabati and Jhanjabati rises in Bijaghata hills of Pottangi area as two small strips. After flowing some kilometer at Goriagada of Narayanapatna they join together and become a river named Jhanjabati. The river flows through Narayanapatna and Rayagada areas until it joins the river Nagavali.

3.5 CLIMATE

The region experiences tropical to sub-tropical climatic condition, Koraput Located at an elevation of 870m aMSL above sea level, Koraput has a tropical wet, dry or savanna climate. The average Temperature of Koraput is around 24°C although it varies from around 7.5°C during Winter (January) to 34.1°C during the Summer (May). The hottest month of the year is May with temperature varies from 22.3°C to 34.1°C. The coolest month is of the year is January, with temperature varies from 7.5°C to 26.8°C.

3.6 HUMIDITY

Humidity is generally high, particularly during the monsoon and post-monsoon months. In contrast, afternoons are comparatively drier in other months. Daily temperature variations lead to morning dew, which farmers often find undesirable. Humidity fluctuates significantly between the monsoon months of June and July and the winter months of November and December. Additionally, the aridity of different regions varies widely. Koraput has sufficient water flowing through its streams to support both people and livestock, even during the hottest summer days.

3.7 RAINFALL

It is observed that about 80% of the total annual rainfall takes place due to South West monsoon between the middle of June & mid-October. The north east monsoon gives erratic & insufficient rainfall. The average annual rainfall varies between 1786.60mm. The district is drought prone because of the erratic and uneven pattern of rainfall.

The rainfall statistics of the district for last five years is given below:

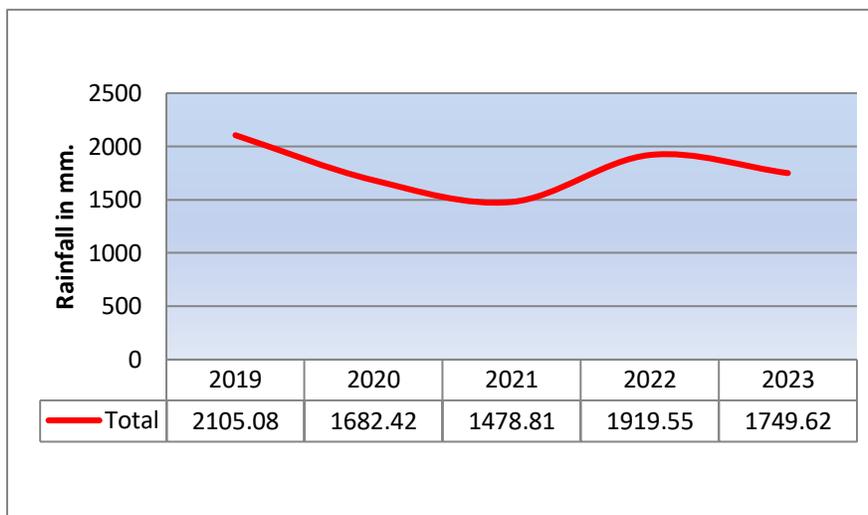

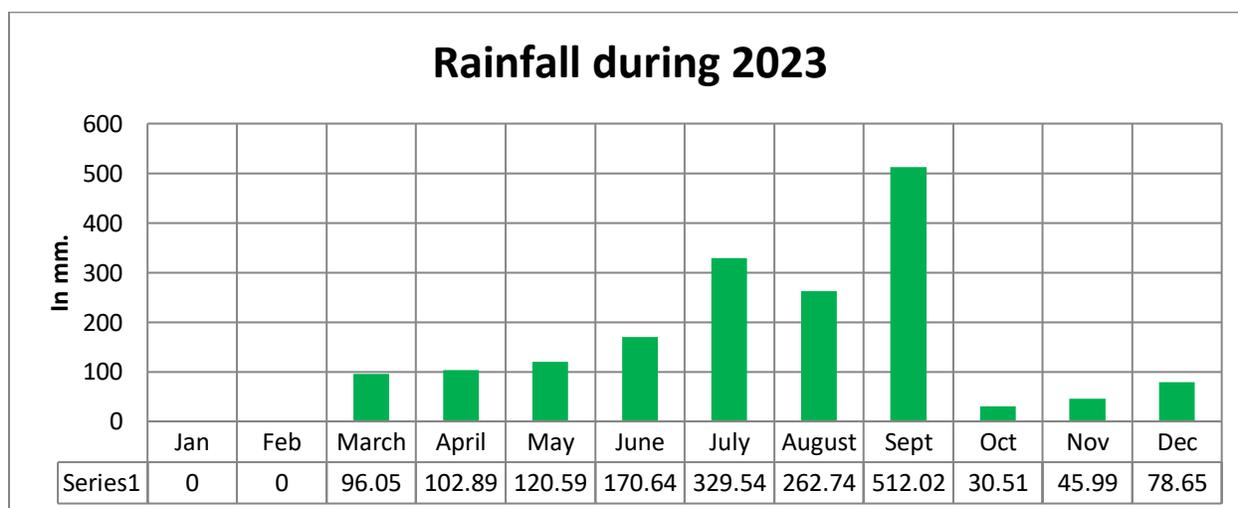

Table-7

YEAR MONTH – WISE RAINFALL (mm) DATA OF KORAPUT DISTRICT (LAST 5 YEARS)													
Year/month	Jan	Feb	March	April	May	June	July	August	Sept	Oct	Nov	Dec	Total
2019	0.91	0	1.6	50.46	63.81	198.3	543.89	590.71	381.49	247.63	25.39	0.89	2105.08

3.8 SURFACE AND GROUNDWATER SCENARIO

The drainage systems i.e. rivers of the district get filled with water during the monsoon and gradually decrease from the month of January to June of each year. In the summer season, all the rivers become almost dry excepting flow of water in a few narrow channels within the basin. The variation of ground water table in the district is as follows:

Table-8

Depth of water level (mbgl)/ Period	April	August	November	January
Minimum	1.15	0.08	0.37	0.30
Maximum	14.17	13.74	13.60	14.20

3.9 ECONOMY

The primarily Economy of Koraput District is based upon forest and agriculture (including shifting cultivation), the bulk of commodities used domestically for everyday use are agricultural and forests products. The district with semi-evergreen to deciduous vegetation endowed with various wild plants as a natural resource.

There are many industrial sectors that contributes to the growth of the economy of the Koraput District. HAL factory (Hindustan Aeronautics Limited, a defense enterprise of the Government of India) is 15km from Koraput town. It has employed more than 6000 employees. The National Aluminium Company Ltd. (NALCO), Damanjodi also has its significance to boost up the economy of Koraput district around 2500 employees are engaged in the process of extraction of Alumina from Bauxite. Other than the employees there are many more local workers engaged by hundreds of contractors in the Govt/ Private works.

3.10 EDUCATION

Educational facilities in Koraput include schools, colleges and university, from primarily to higher studies in the region. Koraput has Woman's Colleges at different parts of district, D.A.V. College at Koraput, Government College of Engineering, Koraput Law College, Government Polytechnic, Government ITI, Central University of Orissa situated at Sunabeda Town and newly formed Vikram Dev University at Jeypore are the institution for higher studies as concerned. A government medical college on the named after Saheed

Laxman Nayak, a great freedom fighter of the region, Medical College and Hospital (SLN MCH) at Koraput. Various private and government day schools-Residential schools are home to several educational institutions.

3.12 CULTURE AND HERITAGE

The traditions of any society are strongly allied and incorporated with its olden times since time immemorial. On the other side the subsistence of civilization is the pedestal of history. If one desires to be familiar with the cultural narration of primordial tribes one must go round towards Southern part of the state of Odisha, the core of tribals. Their tradition and ethnicity are widespread and sparse and hence the cultural history of tribals of Koraput has extraordinary significance all over the country. The district has a tribal population of more than 50 percent.

Religions in Koraput: The city stands as a standing example of diversity. Although the city is dominated by the Hindu population, the Christians and the Muslims also form a significant population. The city popularly referred as the city of tribes has a rich cultural and ethnic heritage which makes the city even more appealing to the tourists. The city houses various holy shrines like Gupteshwar also known as hidden god, Sabara Srikhetra which denotes the Jagannath Temple attracts lakhs of tourists to the city especially during festivals like Maha Shivratri and Jagannath Rath Yatra.

Languages in Koraput: Oriya is the most commonly spoken language by the people of Koraput. The district's linguistic diversity reflects its cultural richness and tribal heritage. As of the location of the district in close proximity to Andhra Pradesh the people of Koraput also have influence of Telugu speaking. All administrative communications, announcements, media interactions are done in English, Odia and Hindi. Desia, Kui, Kondh, Gadaba, Bondo, Didayi, Bonda etc. are the local and tribal languages spoken in the district. The city being an adobe to the tribal populace Tribal Dialects are also significant in the city.

3.13 FESTIVALS, ART, WEAVING AND PAINTINGS IN KORAPUT

The city takes pride in celebrating all the major festivals like Diwali, Eid, Holi, Karwa Chauth, Maha Shiva Ratri or Dusshera with fervor and enthusiasm. The traditional Parab festival showcases the cultural ethnicity of the city.

Parab Festival: The carnival of cultural Heritage of indigenous tribes, Parab festival is being planned by District Council of Culture, Koraput from 1996. This fair of the State is distinctive of this sort intending to mark out buried talent in the field of fine art, traditions,

customs and games at grass-root level and to uphold the wealthy edifying legacy of this district. Every year in the month of November festival is been celebrated all over the district. The whole month of Parab witnesses' events on sports culture, seminar mountain trekking, boat race and artist's camp. On a third day from all over the country are staged on one platform, with crafts mela and exhibitions in the Koraput Parab ground.

In a month-long fiesta intended to conserve the affluent traditional inheritance and local distinctiveness of the tribal which was never given suitable publicity and acknowledgment, was effectively featured. The celebration crafts immense sensation and competitive strength among the countryside society that facilitates in carrying out cultural activities in their atmosphere and also conserving their fine art and expertise so as to lend a hand in the preservation and improvement of prosperous artistic and enriching customs and legacy against the peril of destruction because of swift industrialization, urbanization and globalization.

Competitive programmers in conventional events of music, tribal dances, folk dances, songs, etc. facilitated in the conservation of ethnic cultural legacy of this region. It is a mission to uphold and shelter the wealthy customary skill, dexterity and traditions of this cosmic district. Other than these events there are other events like quiz, essay competitions among the school students and competitions for the physically disabled children to inculcate the competitive spirit and create awareness on the cultural legacy of the region. Besides these there are Craft mela, Artist Camp, Boat race, Cycle race and colloquium are organized to exhibit their cultural heritage. mountain Trekking on Deomali Hill Rance, the highest mountain peak of Orissa makes the carnival an immense event.

Positioned amidst the pristine magnificence of the Eastern Ghats, Koraput is an abode to numerous tribal communities for whom festivals are an integral part of the civilization. They rejoice diverse junctures of their lives with analogous to 'PARABs' like Pusa parab, Chait Parab, Dialiparab, Pond Parab, etc. To respect their ethnicity, the District Council of Culture, Koraput determined to christen its yearly festival as "PARAB". Koraput region, being the medley of tribal life and traditions of the nation, precise prominence is being set to emphasize this enriching inheritance through PARAB and to institute it as a National Festival of indigenous people and celebration of tribals.

PARAB carnival was set in motion in such a gifted moment that the festival not only became the most well-liked merriment of the region but also one of the leading celebrations

of the State. In reality the carnival brought an artistic celebration in the State. Subsequent to this festival in Koraput many neighboring regions began rejoicing events in a spirited style. In addition, several districts began rejoicing festivals like Sambalpur Folk Dance Festival, Puri Sahi Jatra, Ganjam-Surabhi, Malkangiri-Malyabanta mahotsav.

Art, Weaving and Paintings in Koraput: Koraput is famous for its fine art and paintings. Saura painting is a technique of wall mural paintings related with the Saura tribals of Koraput. These paintings are of worldwide significance and contribute greatly to the economy of the city. **Mirigan** is a traditional tribal weaving art form practiced by the **Mirigan** community in Koraput district, Odisha, India. This ancient craft is known for its simplicity, sustainability, and cultural significance. The weaving proficiency in the region is greatly evolved and its fabrics bear testimony to the unique and artistic ability and tradition of the weavers of this state. The ethnic weave of Kotpad village in the district is conventionally woven in gorgeous thick cotton and tussar silk. The utilization of natural pigments extracted from the roots of the madder tree also referred as aal tree makes it distinct from remaining weaves. Koraput Weaving employs a three-shuttle intertwine prototype, which permits countless combinations in level and quantity.

The "**Mirigan**" society of Kotpad region in Koraput district is acknowledged for their beautiful natural colored fabric. They typically knit this fabric for "Bhotada", "Dharua" and other adjoining tribal society depicting their particular culture and ethnicity. The most significant and eye-catching fabric fashioned by this society are Sarees and Shawl etc. The fabric woven by the **Mirigan** community is incredibly contented to be dressed in all through summer and wintry weather. These fabrics are in huge demand both in India and overseas. It is believed that the use of these fabrics prevents one from skin diseases because of the presence of natural dyes.

Costume of Koraput: The ethnic wear of people of Koraput is Dhoti and Kurta, mainly the women wear Sarees and Salwar Kameej.

Cuisines of Koraput: The city offers a platter of dishes with good mix of vegetables in their local cuisine. An authentic meal composes rice, lentils, curry, chutney pickle and a salad. Roti is mostly preferred for dinner. The city is also renowned for the non-vegetarian delicacies fish and meat. Most of the sweet preparations include milk as the foremost

ingredient like Rasagolla, Rasmalai, Rabidi, Rasabali, Chhena. Some of the other famous sweet preparations include Jhili, Jilebi, Kalakand.

3.14 TOURIST PLACES

Tourism of Koraput District occupies a profound place in the State of Odisha. The likes of Duduma waterfall & Hydel project, scenic beauty of Deomali (highest peak of Odisha), Kechela, Jain sites, Balda caves are among a few worth-mentioning. A list of tourist spots in Koraput district is given below:

The Tribal Museum, founded in 1992, holds great importance because of its authentic display of the tribal culture of Odisha, providing a glimpse into their largely unexplored lives. The museum has collections of mines, costumes hand-woven clothes, musical instruments, caters to and educates the tourists about the culture and heritage of the tribals.

Raja Cave & Balmiki Ashram: Raja Caves & Balmiki Ashram in other named known as Kapat Parbat. It is believed the ancestor of Balmiki resides in this site situated on the bank of river Machakund and the river dividing border of Odisha & Andhra Pradesh. It is a scenic spot & best place for trekking in Nandapur block for Eco & Cave tourism. Akhayaturtiya is the main festival of this site.

Onukadelli: Onukadelli in Koraput drawn the attraction of foreign tourists to its weekly market day on Thursday where the Neolithic tribe Bonda come from the inaccessible forest for better purposes. It is 90kms away from Koraput.

Nandapur: The ancient capital of Jeypore Kingdom Nandapur is famous for the presence of Batrisa Sinhasana. It is a 32-step well-preserved relic linked with the fabled throne of Vikramaditya. The arresting red image as a six-feet Ganesha and the shrine of Bhairavnath and other monuments of great antiquity.

Subai: It is a roadside village 16kms from Sunabeda and 34kms away from Koraput has the relics of a Jain monastery, containing rare images of the Tirthankaras.

Jeypore: It is the city of victory is the largest town in the district and home to the royal family is steeped in history. The old fort is encircled by a high masonry wall with an

imposing gateway. Towards the eastern part of the town is a big tank called Jagannath Sagar attracts water sports.

Kanta Baunsuni Damanjodi: It is the town that became famous with the discovery of bauxite mines in the Panchapatmali hills and setting up NALCO, Asia's biggest Alumina complex. Nearby stands the highest peak of Odisha. And World's Second tallest Hanuman Statue that stands at 108.9 feet (33.1meters) located at NALCO township, Damanjodi, Koraput.

Dumuriput: A village stands between Koraput and Sunabeda. The famous Sri Ram Temple situated in the locality is widely known for the highest kneeling Hanuman Statue in Odisha. Ram Navami festival is popularly celebrated every year which attracts a large number of devotees.

Kolab Dam: Kolab- At an altitude of about 3000 ft. above sea level on river Kolab, stands the majestic Kolab Reservoir generating Hydro Electric Power. The place is highly admired for its scenic beauty, attracting people for weekend picnic and boating.

Jalaput: It is a dam reservoir over the Kolab river. It is 68.2 sq.km in the area and an idyllic place of picnic and pleasure trip. It is 77kms away from Koraput.

Sunabeda: It is a modern township & famous for MIG fighter planes, Sukhoi factory & museum containing aircraft engines displayed worthy to be seen.

Gulmi: Kolab river forming a whirlpool at Gulmi and attracting large crowd from the district as well as from Chattisgarh state.

Kechela: It is a village is known for the copper plate. There is a Jain temple about 30 ft. high contains 05 images of Tirthankaras namely Resavanath, Mahavir Jain, Ambika Devi, Jakhya & Jakhyani. The images are chiseled with great care and achieve a high standard of art which indicates the Kechela was a seat of Jainism in the medieval period.

Machhakund (Duduma): It is the waterfall, popularly known as Matsya Tirtha of epic fame falls from a height of 175meters. Set in the heart of a picturesque hill, Duduma 70kms to the South of Jeypore, and 88kms away from Koraput is a rocky outlet for the River Machhakund, which flows through this rough terrain. Rock-climbing enthusiasts can try reaching the base of the fall from the opposite side of the hill, a route tribals claim can be Terribly Strenuous.

Deomali: The highest mountain Peak of Odisha Deomali 1762mt. high nestling in the lap of the Eastern Ghats is an ideal for Aero Gliding and trekking expeditions.

Gupteswar: Gupteswar is a cave temple located on the banks of Kolab River, about 80km from Koraput. Important cave shrine of Lord Shiva situated on a lime stone hill amidst scenic bliss. The temple houses a sacred Swayambhu Shivling called Gupteswar, which literally means the Hidden God.

Sabar Shreekshetra: Sabar Shreekshetra means the Sreekshetra of Sabar Peoples in Odisha where a beautiful Jagannath Temple has been built at a height of 940mts above the sea level located in Koraput town of Odisha, which permits entry to people irrespective of their religion, caste and creed.

Raisil: This place in Koraput is ideal for trekking surrounded by natural scenery. “Anla Navami” is celebrated every year with huge colorful gatherings.

Maliguda: About 43km northwest from Koraput and 21kms eastwards of Jeypore is a small village where on a hilltop stands India's highest broad gauge railway tunnel. The place is ideal for a weekend picnic.

CHAPTER-IV

GEOLOGY OF THE DISTRICT

4.1 PHYSIOGRAPHY AND GEOMORPHOLOGY

The entire Koraput district has a unique physiographic set up. Excepting the north western and west central part, the rest of the district is occupied by densely forest with highly rugged mountains, interspersed with intermontane valleys. The elevation of the hilly terrain ranges from 900 to 1400m above mean sea level with the highest peak of 1620mamsl. The major geomorphic units of the district are classified as - Flood plain, mesa/butte, Denudational hills, Pediment, deeply weathered Pedit plain, Inselberg, Structural hills, severely dissected plateau, Intermontane valley, Structural valley, Residual hill and Bazada. The average rainfall of the plateau is 1560 mm of greater part falls during the months of July and August.

The drainage pattern in the district is controlled by Indravati, Sabari (Kolab), Sileru, Vegavati, Subarnamukhi, Machhkund, Jhanjabati/Champabati rivers and their tributaries drains westward towards the Godavari valley. The river Kolab and Indravati drains the major parts of Koraput district; most of the tributaries of river Kolab and Indravati are perennial in nature. East-west flowing Indravati and North-South flowing Sabari River pass through the northern and western border of Koraput district. Northeast-Southwest flowing Kolab river traverses through the central part of the district. The rivers in general exhibit dendritic drainage pattern and are effluent in nature.

4.2 GEOLOGY

A major part of the Koraput district is underlain by hard rocks of Pre-Cambrian age. The consolidated rocks of upper to middle Proterozoic age occupy a small portion of north-western part of the district. The Recent to sub-recent alluvium occurs as thin and discontinuous patches in limited scale along the prominent drainage channel. The Laterite occurs as their capping over the country rocks in isolated pockets.

The generalized stratigraphic sequence in the district is given below Recent to Sub-recent Alluvium, Laterite Upper to middle Proterozoic Chhattisgarh Group Purple shale, limestone, Basal quartzite. Proterozoic to Archaean Bengal group Quartzite, Quartz

and biotite gneiss Eastern Ghat group Biotite bearing garnetiferous granite. Gneiss with mega-crystal of white Feldspar. Acid, intermediate, basic Charnockite. Archaean Garnet-sillimanite Schist, khondalite, Quartzite & calc-granulite. Rock assembles in the area are as follows;

Granite Gneisses -These rock types of Eastern Ghats Group generally occur in the undulating plains and sometimes forms hills and hillocks. These rocks are mostly represented by biotite gneiss, porphyritic granitic gneiss etc. They are porphyritic and non-porphyritic in nature and are usually grey to light grey in colour.

Khondalites -This suite of rocks comprises mainly of quartz - garnet sillimanite gneiss and schist, garnetiferous sillimanite gneiss and schist, garnetiferous sillimanite quartzite and calc-granulite, which occurs in an interbedded sequence. Khondalite are found associated with charnockite and porphyroblastic granitoid gneiss. The rocks are grayish brown to reddish brown in colour and are well foliated. The occurrence of quartzite and calc granulites are very limited and sporadic.

Charnockite -This suite of rocks comprises of pyroxene granulite (basic), hypersthene granite and granodiorite (acid and intermediate). These are generally found to occur in south and central part of the district. The acid and intermediate variety of charnockite is more prominent and form longer bodies than the basic variety. The charnockite are fine to coarse grained, greenish grey colour having greasy lustre.

Quartzite -These includes quartzite, garnet andalusite gneiss of Bengal Group. These are metasediments occupying limited area in western part of the district. Shale, limestone and Quartzite - These belong to Chattisgarh Group of middle to upper Proterozoic age. These rocks occur unconformably over granite gneisses. These are slightly metamorphosed and consist of white nonfeldspathic quartzites, impure limestone and purple shales. These rocks are generally exposed in the north-eastern part of the district. These rocks are best exposed around Gupteswar-Ramgiri area in Boipariguda blocks.

Laterite and Alluvium -These are reddish, porous, concretionary material occurs as capping over the country rocks. Considerable thickness of Laterite mainly of detrital origin has also been formed or shaly formation around Kotpad area. Laterite generally occurs due to intensive weathering under extreme oxidizing conditions in tropical to sub-tropical climate characterized

4.3 STRATIGRAPHY

The geological succession in the district is as follows;

Table-12

Age	Super Group	Group	Litho-unit
Cenozoic			Laterite and Lateritic bauxite
Meso to Neo-Proterozoic	Chhatisgarh	Sabari	Shale Limestone Sandstone
Palaeo to meso-Proterozoic		Tulasi dongar	Gabbro and related basic rocks Sandstone
Proterozoic		Intrusive	Quartz vein Granite Dolerite
Archaean to Proterozoic	Eastern ghat	Migmatite	Granite gneiss, Leptynite (Acid to Intermediate)
		Charnocite	Charnockite, pyroxene granule, Garnetiferous sillimanite
		Khondalite	Schist/gneiss, Porphyry granite, meta basics, Amphibolite
Archaean		Bengal	Andalusite Schist, Hornblende schist, magnetite quartzite, quartz-magnetite-grunerite schist

4.4 MINERAL RESOURCES

Koraput, a district in the state of Odisha, India, is rich in mineral resources. Some of the key minerals found in Koraput include:

- **Bauxite:** The district has acquired a distinct place in the global mineral map for its vast reserve of bauxite, the ore for aluminium. Bauxite occurs as duricrust on a number of khondalite, charnockite plateaus/tableland namely Panchpatmali, maliparbat, Pottangi, Karnapadikonda, Kodingamali and Ballada, medium and small plateaux like Hatimali, Gusuramali, Ramagarh, Chemamali, Sargighatimali, Karki, Khurji, Barhapadar, Kaurikhala, Geruput, etc. bauxite, mainly aluminous mineral is Gibbsite. Panchpatmali plateau is the longest stretches over 21km and average width of 2.5km which is the longest in the Asia, where large scale bauxite mining is being carried out by giant- aluminium Central Govt PSU, NALCO. Besides there are other working bauxite mines i.e. Kodingamali, Maliparbat in the district.

- **Limestone:** Limestone is the second most important mineral after bauxite, Occurrences of large cement and flux grade limestone deposits have been reported from Ampavalley (igneous variety) of excellent quality (cement grade) average CaO content are 45-50%, Binsuli (sedimentary variety) are 45-50% and Gupteswar, Dumajodi-Kondajodi, Siribeda (stromatolitic Limestone- Organo-sedimentary type) are 45-50% respectively. Apart from these minor occurrences of limestone and lime kankar are found in the district.
- **Manganese:** Important manganese occurs found as pockets near Devajholla, Podaguda, Khalkona, Konapai, Pukkiti, Dumuriput and Kutinga villages.
- **Ochre:** Minor deposits of red Ochre in the host rock of charnockites near Machhkund, Lula and Addumanda reported similarly yellow ochre near Boipariguda.
- **Quartzite:** Quartzite containing SiO₂ between 95% to 98.5% have been reported from Dalapur, Kamahandi, Baghachuan, Pandrichintalu and Bangariguda village areas.
- **China clay:** Large and small sized deposits of China clay of inferior quality have been reported in the district. Highly siliceous China clay occurs near Demasaguda, Bondosal, Sorispadar, Pandrimati and Jorahiguda villages. Kaolin varieties has been reported in the Boipariguda, Oduguda, Musoriguda. Fireclay has been noticed in Deodar. The clay is used by the locals for manufacture of roofing, paving tile, flower pots, vases, etc.
- **Mica:** Mica deposits have been reported from Limca, Dabugura, Kudamandi and Kanapadar village areas.
- **Graphite:** Occurrences of amorphous and disseminated graphite have been reported from Raishila village.
- **Gold:** Field evidences gathered so far arouse hope for future prospects of gold near villages Bathiguda, Pandiguda and Malayguda in Kolab river catchment area.
- **Semi-precious stone:** stray Occurrence of cat's eye, moonstone has been reported near Turia and Lula villages indicate possibility of gem tract in the district.
- **Dimension and decorative Stones:** The district has a substantial reserve and has potential for exploitation of dimension and decorative stones.
 - **Dolerites-** Girigaon, Santoshpur, Bichalkuta
 - **Augen gneiss -**Marichmal, Charanguli, Telar, Burja, Laxmipur, Kusumguda
 - **Pink granite** –Binesuar

CHAPTER-V

5.1 DRAINAGE AND IRRIGATION PATTERN OF THE DISTRICT

The drainage of the district is mainly controlled by rivers like Indravati, Kolab & Machhkund having majorly dendritic pattern to sub-parallel. Valleys, Waterfalls, Floodplains, Terraces, Meanders and Oxbow lakes are the landforms developed on the courses of the river in the area. Indravati, Kolab and Machhkund river forming the source for drainage and irrigation system in the district. Detail of the river system is narrated below.

Table-13

Sl. No	Name of the River	Place of origin	Altitude at origin (in meter)	Total length in the district (in km)	Area drained (sq.km.)	% area drained in the district	Process on deposition of sediments	Volume of Sand deposited in last four years (Year wise)	Any important note related to leasing of Sand quarry within the river
A	B	C	D	E	F	G	H	I	J
1	INDRAVATI	Mardiguda, T. Rampur, Kalahandi	914	83	40,625	46	Moderate	-	-
2	KOLAB	Sinkaran Hills, Eastern Ghats, Koraput	914.4	95	20,427	100	Moderate	-	-
3	MACHHKUND	Eastern Ghats In Andhra Pradesh	175	60	2,222.21	70	Moderate	-	-

Drainage Pattern: The district is drained by several rivers, including Kolab River, Machhakund River, Indravati River and their numerous tributaries smaller streams and rivulets feed into these main rivers. River shows a large area of watersheds in the district, several watersheds, including the Indravati, Kolab, and Machhakund watersheds.

Irrigation Pattern:

1. Major Irrigation Projects: Machhakund Hydro Electric Project, Kolab Dam Project, Narayanpatna Irrigation Project, Sagada Irrigation Project
2. Medium Irrigation Projects: Bagra Irrigation Project, Dandabadi Irrigation Project, Nandapur Irrigation Project

3. Minor Irrigation: Lift irrigation schemes, Tube wells, Check dams

4. Water Harvesting Structures: Water Tanks, Reservoirs

5.2 PROCESS ON DEPOSITION OF SEDIMENTS

i. Erosion

- **Upstream Erosion:** Sand and sediments are primarily generated through erosion of rocks and soil in the upstream areas of the river. In the case of the Indravati River, the erosion could occur in the hilly regions of the Eastern Ghats.
- **Human Activities:** Deforestation, agricultural activities, and construction work can increase the rate of erosion, leading to more sand and sediment being carried by the river.

ii. Transportation

- **River Flow:** The sand and sediment eroded from upstream areas are transported downstream by the flow of the river. During the monsoon season, the flow is stronger, and more sand is carried.
- **Suspension and Bed Load:** Sand is transported in two forms: suspension (floating within the water) and bed load (rolling or sliding along the riverbed).

iii. Deposition

- **Decrease in River Velocity:** As the river reaches flatter areas or the riverbed widens, the flow velocity decreases. This reduction in velocity causes the river to lose its capacity to carry sand, leading to deposition.
- **Sand bars and Islands:** Over time, the deposited **Sand** forms **Sand** bars or islands in the river, especially in areas where the river meanders or its gradient reduces.
- **Seasonal Variations:** Deposition is often more pronounced during the dry season when the water level decreases, leaving more sand exposed along the riverbanks and on sand bars.

iv. Human Influence

- **Mining Activities:** In some regions, sand mining can alter the natural deposition process, either by removing sand or changing the river's course.

- **Dams and Barrages:** The construction of dams and barrages can also influence sand deposition by controlling the flow of water downstream.

v. **Impact on Ecosystem**

- **Habitat Formation:** The deposited sand creates new habitats for various species of plants, birds, and aquatic animals.
- **Agricultural Impact:** In regions like Koraput, the deposition of sand on agricultural land can sometimes be detrimental to farming, though in some cases, it might also replenish soil nutrients.

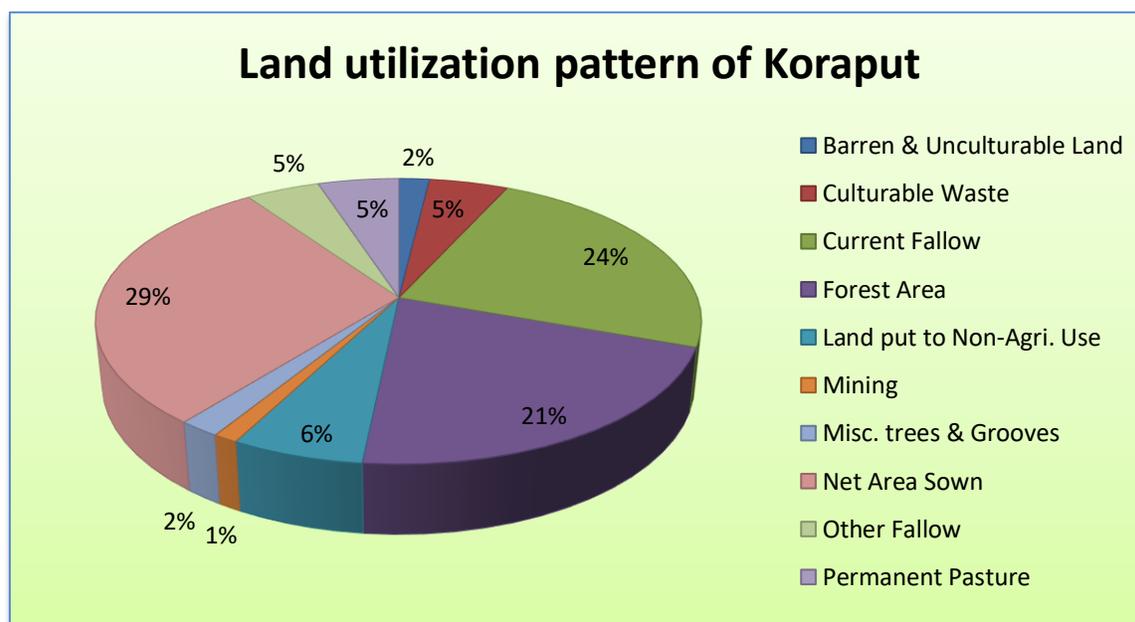

CHAPTER-VI

LAND UTILISATION PATTERN

The Agro-Climatic Zone, Land utilization pattern of Koraput district is as follows:

Table-13

SI No	Land use	Area in '000Ha
1	Forest Area	188
2	Misc. trees & Grooves	17
3	Permanent Pasture	45
4	Culturable Waste	44
5	Land put to Non-Agri. Use	54
6	Barren & Unculturable Land	17
7	Current Fallow	210
8	Other Fallow	41
9	Net Area Sown	263
10	Mining	10

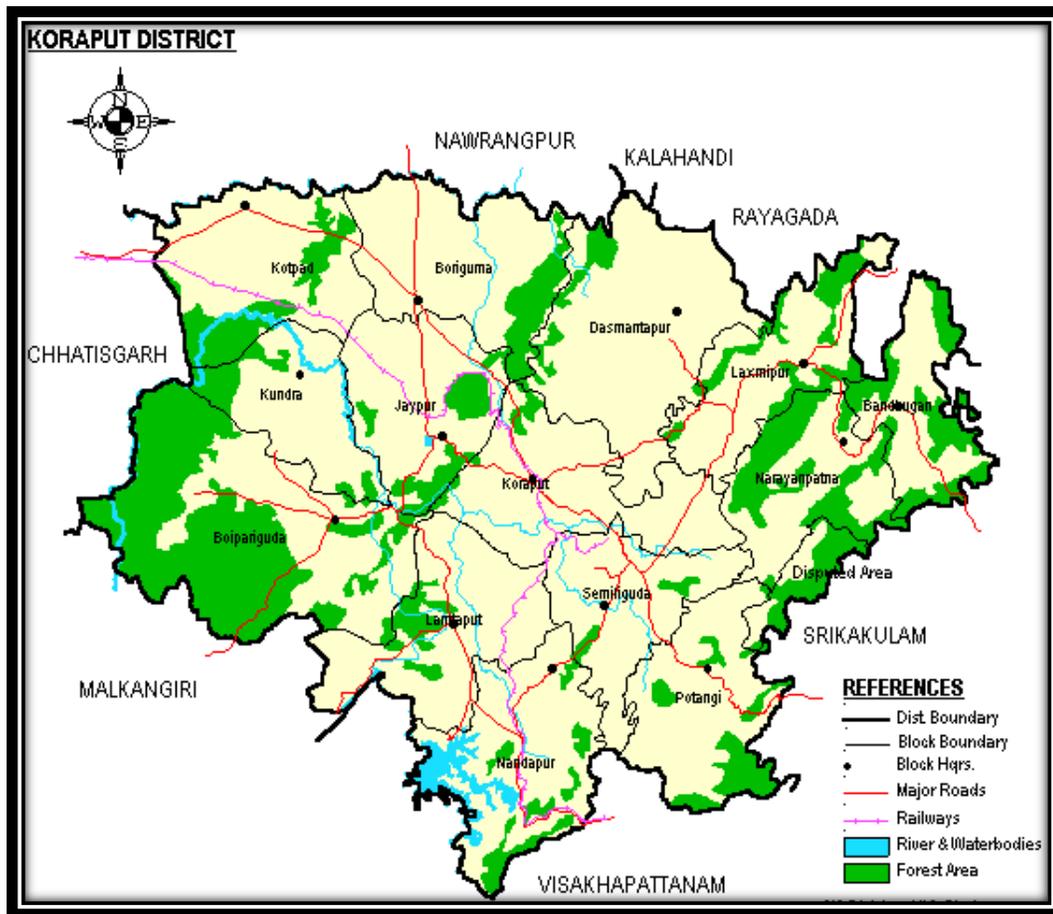

6.1 FOREST PROFILE OF THE DISTRICT:

Koraput district in Odisha, is known for its lush forests, provides products of Timber (sal, teak, kendu), Non-Timber Forest Products (NTFPs): kendu leaves, mahua flowers, etc. and Medicinal plants. Forest covering area of approximately 1,88,000 ha, Types of Forest in the district are Tropical Deciduous Forests, Tropical Evergreen Forests, Moist Deciduous Forests, Sal (*Shorea robusta*) Forests.

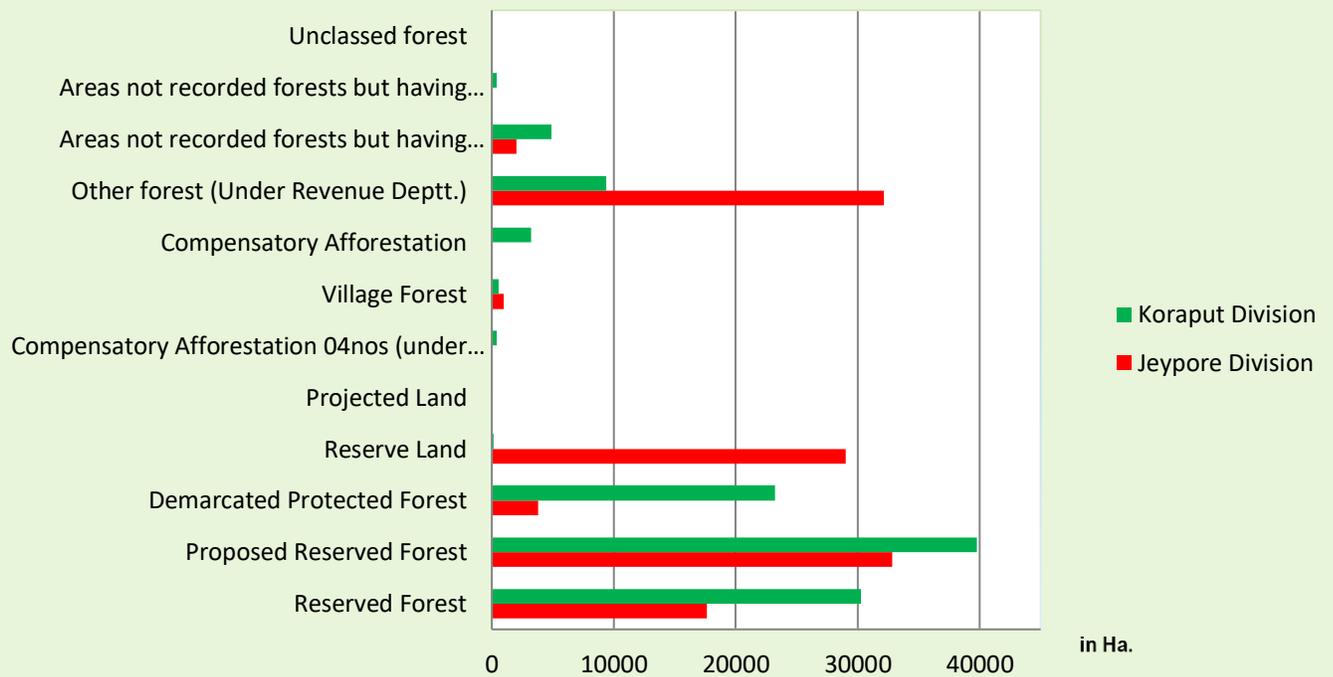

The district with its two Forest divisions namely Koraput Forest Division, Jeypore Forest together, these divisions encompass a total of 12 ranges, each contributing to the rich biodiversity and ecological health of the area. The forests play a crucial role in supporting local wildlife, protecting watersheds, and providing resources for the community. Details as below:

Table-14

Status	Total Area in Ha (Jeypore division)	Total Area in Ha (Koraput division)
Reserved Forest	17608.4354	30251.2037
Proposed Reserved Forest	32853.2425	39779.1841
Demarcated Protected Forest	3786.7214	23232.7944
Reserve Land	29002.4208	151.8100
Projected Land	NIL	33.3700
Compensatory Afforestation 04nos (under Sec 32)	NIL	415.9905
Village Forest	1001.96	558.1600
Compensatory Afforestation	22.085	3203.8540
Other forest (Under Revenue Deptt.)	32137.24	9403.9700
Areas not recorded forests but having characteristics of forest (Govt)	2005.00	4901.2700
Areas not recorded forests but having characteristics of forest (Pvt.)	16.371	388.8400
Unclassed forest	-	40.11

District Forest area

6.2 AGRICULTURE PROFILE OF THE DISTRICT:

Agriculture is yearlong practice for living till day, with due time human developed new ideas and technique on it for yielding. Koraput is one of the agricultural districts in the state, with various farming practices were adopted for better production as extensive farming, mixed farming, shifting agriculture, plantation farming, crop rotation, terrace agriculture, dairy farming, commercial farming apart Koraput is well known for its organic farming. Details as below:

Table-15

Sl. No.	Items	Koraput Agriculture District (Eastern ghat high land)	Jeypore Agriculture District (South Eastern ghat)	Koraput Revenue District
01	Climate	Warm & Humid	Warm & Humid	Warm & Humid
02	Mean Annual Rain Fall (mm)	1521	1710	1567
03	Mean Max. Summer Temp.	34.1°C	34.1°C	34.1°C
04	Mean Min Winter Temp.	7.5°C	13.2°C	10.4°C
05	Soil Type	Lateritic Soil, mostly red with sufficient organic matter content	Red, Red & Yellow mixed soil with adequate organic matter content	Red, Red & Yellow mixed soil with adequate organic matter content

Table-16

	District Agricultural area	Land Use (Fig in '000' ha)
1.	Geographical Area	8,81,000
2.	Cultivable area	301500
3.	Cultivated Area	
	High	1,85,540
	Medium	78,530
	Low	33,480
	Total	297550
4	Paddy Area (Kharif): -	
	High	17627
	Medium	34893
	Low	33480
	Total	86000

5	Cropping Intensity		
		Year	Cropping Intensity (%)
		2019-20	126.54
		2020-21	127.17
		2021-22	127.24
		2022-23	127.24
		2023-24	127.50

8	Major Crops		
		Kharif	Paddy, Ragi, Maize, Niger, Vegetables
		Rabi	Paddy, Vegetables, Sugarcane

Farmer Category in the district

1. Large Farmers (>10ha) : 494 nos (0.29%)
2. Medium Farmers (4- 10ha) : 4596 nos (2.75%)
3. Semi Medium Farmers (2-4ha) : 22830 nos (13.7%)
4. Marginal Farmers (<1ha) : 85071 nos (32.2%)
5. Small Farmers (1-2ha) : 53743 nos (32.2%)
6. Landless : 290626 nos
7. Average size of holding : 1.77ha
8. Fertiliser consumption : During 2021-22, the total fertilizers used in the district was about 5,350m.T.

Quantity of consumption of various fertilizers are as below;

Table-17

Type of fertilizer	Nitrogenous	Phosphatic	Potassic	Total	Consumption Kg/per Ha
Quantity in mT	14,220	7,710	3,560	25,490	75.35

6.3 HORTICULTURE PROFILE OF THE DISTRICT:

The primary objective of the Horticulture Department is to enhance the production and productivity of major fruits, such as mangoes, guavas, and citrus, which are widely cultivated in the district. Additionally, the department aims to support the overall development of the local farming community. The Deputy Director of Horticulture serves as the head of the office. The horticulture statistics for the district is shown in subsequent tables below:

Table-18

Sl No	Year	Fruit plantation (Area in ha /Nos)																Name of scheme		
		Mango Normal	Cashew	Mango High Density	Banana TC	Papaya	Litchi	Pine Apple	Pomegranate	Amla	Mixed Fruit	Guava	K. Lime	Black pepper	Apple	Orange	Tamarind

Decorative Stone & China clay	147.628 Cum	640.068 Cum	2162.722 Cum	3290.423 Cum	4830.829 Cum

10. MINERAL MAP OF THE DISTRICT:

11. LIST OF LETTER OF INTENT (LOI) HOLDERS IN THE DISTRICT ALONG WITH ITS VALIDITY

Nil

12. TOTAL MINERAL RESERVE AVAILABLE IN THE DISTRICT

Total mineral reserve of Sand will access after detail study or grant of potential area, which may investigate as per details below.

- (i) Blocks were identified based on geological studies through field observation.
- (ii) Mineable resource was calculated by considering detail prospecting.
- (iii) Area calculated as per GPS co-ordinates and information obtained from local people. Land detail need to be verified from revenue record.
- (iv) Since this is an interim report, as per the present requirement of minerals, more such blocks need to be identified and the data should be updated periodically, after certain intervals to update the data bank of DSR.

Summary of Identified Mineral Potential: Annexure- II

13. QUALITY/GRADE OF MINERAL AVAILABLE IN THE DISTRICT

Sand of the District is very much suitable for making of various construction purposes. Good quality of sand derived from rivers of district.

14. USE OF MINERAL:

In the district, sand is predominantly utilized in road and building constructions. Whether for paving roads or creating foundations for buildings, the local sand supply plays a crucial role in supporting the region's development and infrastructure projects.

15. DEMAND AND SUPPLY OF THE MINERAL IN THE LAST THREE YEARS:

As such there are huge infrastructural activities such as road, building, railways are coming up by Govt. of India & PSUs under "Make in India" programme. It is proposed to start the Sand production for fulfill the Requirement of the District which will enhance the revenue of the district and also support the livelihood of the local people.

Details of Demand and Supply of Minor Minerals for last three years as received from R&B Division, Koraput is furnished below:

Table-26

Sl. No.	Mineral Type	2021-22		2022-23		2023-24	
		Demand	Supply	Demand	Supply	Demand	Supply
1	Sand	109073.28	109073.28	18760.45	18760.45	64769.11	64769.11
2	Morrum	-	-	227912.00	227912.00	475000.00	475000.00
3	Building Stone	50819.49	50819.49	345225.70	345225.70	731444.40	731444.40
4	Laterite	-	-	-	-	-	-
5	Ordinary Earth	-	-	683737.00	683737.00	1425000	1425000

16. MAP OF EXISTING MINING LEASES IN THE DISTRICT:

Plate-I

17. DETAILS OF THE AREA OF WHERE THERE IS A CLUSTER OF MINING LEASES VIZ. NUMBER OF MINING LEASES, LOCATION (LATITUDE AND LONGITUDE)

Annexure-III

18. DETAILS OF EXTENDED ECO-SENSITIVE ZONE, IF ANY, IN THE DISTRICT:

Eco sensitive zone of Gupteswar Bio-heritage Site- 350.00 Ha is located within the district.

19. CURRENT PER CAPITA POWER CONSUMPTION PER MONTH/ANNUM:

Per Capita Consumption (Units) in Koraput District for the FY 23-24

- Annually Consumption : 329 Units
- Monthly Consumption : 27.42 units

20. IMPACT OF MINING ON ENVIRONMENT ATTRIBUTED TO MINING ACTIVITIES: -

Generally, the impact of mining activities on environment can be categorized as either primary or secondary. Primary Impacts are those, which are caused directly during operation of various existing projects. Secondary impacts are induced by expansion of project area,

enhancement in production or addition of ancillary units by the project proponents themselves or dependent secondary and tertiary units.

- **Impact on Ambient Air Quality:** Mining operation in the district is carried out mostly by opencast semi-mechanized /mechanized methods and rarely by manual methods generating huge volume of dust particles. Such generation is the result of various activities like blasting, excavation and loading by heavy machineries (power shovels, surface miners, haul packs etc.), processing off minerals in crushers, coal handling plants and transportation by large dumpers and trucks. The air quality in the mining areas depends upon the nature and concentration of emissions and meteorological conditions. The major air pollutants due to mining activities include: -
 - i. Suspended Particulate matter (dust) of various sizes.
 - ii. Gases, such as Sulphur dioxide, oxides of nitrogen, carbon monoxide etc. emitted from heavy mining machineries.
 - iii. Waste and mineral transporting vehicles.

Transpiration sources of air pollutants include heavy vehicles used in excavation operations, cars that transport personnel at the mining site, and trucks that transport mining materials. The level of polluting emissions from these sources depends on the fuel and conditions of the equipment. Even though individual emissions can be relatively small, collectively these emissions can be of real concern. In addition, mobile sources are a major source of particulate matter, carbon monoxide, and volatile organic compounds that contribute significantly to the formation of ground-level ozone. The main gaseous emissions are from combustion of fuels in power generation installations, and drying, roasting, and smelting operations. Many producers of precious metals smelt metal on-site, prior to shipping to off-site refineries. Typically, gold and silver are produced in melting/fluxing furnaces that may produce elevated levels of airborne mercury, arsenic, sulfur dioxide, and other metals. Common sources of fugitive emissions include: storage and handling of materials; mine processing; fugitive dust, blasting, construction activities, and roadways associated with mining activities; leach pads, and tailing piles and ponds; and waste rock piles. Sources and characteristics of fugitive emissions dust in mining operations vary in each case, as do their impacts. Impacts are difficult to predict and calculate but should be considered since they could be a significant source of hazardous air pollutants.

- Impact on Water Quality:** Sometimes, mining particularly in underground operations lead to interception with the water table causing lowering of ground water table may leads to Groundwater Contamination: Mining activities (Mine tailings and waste rock, Processing plant effluent, Leaks from mines and pipelines, Abandoned mines) compromise aquifer quality. Due to the interference with surface water sources like river, nallah etc. and the entire drainage system downstream of the area is adversely affected. Leaching and Sedimentation leads to mining waste and runoff harms to aquatic habitats. Oil, grease and other lubricants are also carried by surface run off to natural water courses polluting water quality. Acid mine drainage is considered one of mining most serious threats to water resources. A mine with acid mine drainage has the potential for long-term devastating impacts on rivers, streams and aquatic life. If mine waste is acid generating, the impacts to fish, animals and plants can be severe. Many streams impacted by acid mine drainage have a pH value of 4 or lower – similar to battery acid. Plants, animals, and fish are unlikely to survive in streams.
- Impact on Noise Level:** Noise pollution is mainly caused due to Blast vibrations, operation of heavy machineries (drilling, excavation, and haulage), Crushing-processing plant noise and plying of Transport and logistics noise. Noise may impact on quality of Life, human health and wildlife can disrupts their communication, migration, and habitats. Vibrations are associated with many types of equipment used in mining operations, but blasting is considered the major source. Vibration has affected the stability of infrastructures, buildings, and homes of people living near large-scale open-pit mining operations. According to a study commissioned by the European Union in 2000: “Shocks and vibrations as a result of blasting in connection with mining can lead to noise, dust and collapse of structures in surrounding inhabited areas. The animal life, on which the local population may depend, might also be disturbed.”
- Land degradation:** Since winning of minerals involves huge volume of excavation of earth’s surface, land degradation cannot be dispensed with. Similarly, dumping of solid waste also creates problem. But lots of remedial measures are in the statute to prevent such degradation.
- Impact on Flora & Fauna:** Impact on biodiversity is difficult to quantify because of its diverse and dynamic characteristics. Mining activities in forest area also cause deforestation,

land degradation, water, air and noise pollution which directly or indirectly affect the fauna and flora status of the project area and its ambience.

21. REMEDIAL MEASURES TO MITIGATE THE IMPACT OF MINING ON THE ENVIRONMENT-

Air:

Mitigation measures suggested for air pollution controls are to be based on the baseline ambient air quality of the project/cluster area and would include measures such as:

- Water spraying on haul roads, service roads and overburden dumps.
- Proper and regular maintenance of mining equipments.
- Transports of materials in trucks are to be covered with tarpaulin.
- The mine pit water, if any can be utilized for dust suppression in and around mines area.
- Information on wind direction and meteorological factors are to be considered during planning, so that pollutants, which cannot be fully suppressed by engineering techniques, can be prevented from reaching the nearby human habitat.
- Comprehensive greenbelt around overburden dumps and periphery of the mining projects/clusters has to be developed and monitored to reduce to fugitive dust transmission from the project.
- Compaction of terraces, coirmat, geotextiling along dump slopes followed by plantation.

Water:

- Construction of garland drains and settling tanks to divert surface run-off of the mining area to the natural drainage.
- Construction of checks dams/ gully plugs at strategic places to arrest silt wash off from broken up area, if required.
- Retaining walls with weep hole are to be constructed around the mine boundaries to arrest silt wash off in case of big quarries.
- The mined-out pits can be converted in to the water reservoir after reaching ultimate pit limit. This will help in recharging ground water table by acting as a water harvesting structure with Mine design and planning.

- Water treatment and monitoring in Periodic basis of mine pit water and ground water quality in nearby villages are to be undertaken.
- Domestic sewage from site office & urinals/latrines, if any provided within ML/QL areas is to be discharged in septic tank followed by soak pits.
- Regular Environmental impact assessments.
- Rehabilitation and reclamation are both processes that can be used to restore mined land
- Proper Regulation and enforcement of mines.

Noise:

- Machinery maintenance and upgrade; Periodic maintenance of machineries, equipment shall be ensured to keep the noise generated within acceptable limit also maintaining Blast optimization and scheduling
- Noise monitoring and modeling; Development of thick green belt around mining/cluster area, avenue plantation along haul roads to reduce the noise.
- Conducting periodical medical checkup of all workers for any noise related health problems.
- Proper training to personnel to create awareness about adverse noise related effects.
- Sound barriers and enclosures; Periodic noise monitoring at locations within the mining area and nearby habitations are to be undertaken for big QL areas to assess efficacy of adopted control measures.
- Community engagement and noise management plans to be trained.

Biological Environment

- Development of greenbelt/gap filling saplings in the safety barrier left around the quarry area/ cluster area, if the safety zone areas are barren.
- Carrying out thick greenbelt with local flora species predominantly with long canopy laves on the inactive mined out upper benches.
- Development of dense polyculture plantation using local floral species in the mining areas at conceptual stage if the mine is not continued much below the general ground level.
- Adoption of suitable air pollution control measures as suggested above.
- Transport of materials in trucks covered with tarpaulin.

22. RECLAMATION OF MINED OUT AREA: -

As per statute, all mines/quarries are to be properly reclaimed before final closure of the mine. Reclamation of exhausted mines are planned to be undertaken in three possible means depicted below;

1. If, substantial quantity of waste is there, the exhausted quarry can be fully or partly backfilled using the stored waste. The backfilled areas are to be brought under plantation of local species.
2. If the generation of waste is much less as in the case of minor mineral mining, the exhausted quarries can be reclaimed by
 - a. Plantation on the broken-up surface if the depth of quarry is not much below the surrounding surface level.
 - b. Conversion to water reservoir after stabilization of the slopes if the exhausted quarry continues much below the surrounding surface level. It is preferred to cordon the water reservoir either through wire fencing or retaining wall with plantation from the safety point of view.

Most of the quarry/mining lease areas are yet to be exhausted from ore point of view. Hence, reclamation would be taken up only after exhaustion of the ore/mineral content from these areas. The exhausted minor mineral quarries of the district have been converted to water reservoirs.

23. RISK ASSESSMENT & DISASTER MANAGEMENT PLAN:

The risk relating to mining of minor mineral except natural calamities is slope failure and probable accidents due to high and ill maintained bench walls. This can only be addressed through making of regular benches and undertaking mining in benching pattern. The disaster management plan (DMP) is supposed to be a dynamic, changing, document focusing on continual improvement of emergency response planning and arrangements.

The disaster management plan is to be aimed to ensure safety of life, protection of environment, protection of installation, restoration of production and salvage operations in this same order of priorities. For effective implementation of the disaster management plan, it should

be widely circulated through rehearsal/induction conducted by the respective department from time to time.

24. GENERAL RESPONSIBILITIES OF EMPLOYEES' DURING AN EMERGENCY:

During an emergency, it becomes more enhanced and pronounced when an emergency warning is raised, the worker in-charge should adopt safe and emergency shut down and attend to any prescribed duty. If no such responsibility is assigned, the workers should adopt a safe course to assemble at a specified point and wait for instructions. He should not resort to spread panic. On the other hand, he must assist emergency personnel for the objectives of DMP.

The mine manager who is responsible for emergency will always keep a vehicle ready at site. In case of any eventuality, the victim will be taken to the nearby hospitals after carrying out the first aid at the site. The manager should collect and have adequate information of the nearby hospitals, fire station, police station, village panchayat heads, taxi stands, medical shops, district revenue authorities etc. and use them efficiently during the case of emergency.

25. DETAILS OF THE OCCUPATIONAL HEALTH ISSUES IN THE DISTRICT: -

As per the guidelines of the Mines Rules 1955, occupational health safety has been stipulated by the ILO/WHO. The proponents will take necessary precautions to fulfil the stipulations. Normal sanitary facilities have to be provided within the lease area. The management will carry out periodic health checkup of workers.

Occupational hazards involved in mines are related to dust pollution, noise pollution, blasting and injuries from moving machineries & equipment and fall from high places. Directorate General Mines Safety (DGMS) has given necessary guidelines for safety against these occupational hazards. The management has to strictly follow these guidelines. All necessary first aid and medical facilities are to be provided to the workers. The mines shall be well equipped with personal protective equipment (PPE). Further, all the necessary ported equipments such as helmet, safety goggles, earplugs, earmuffs etc. are to be provided to mine workers as per mines Rules. All operators' and mechanics are to be trained to handle firefighting equipments.

26. PLANTATION OF GREEN BELT DEVELOPMENT IN RESPECT OF LEASES ALREADY GRANTED IN THE DISTRICT:

As most of the minor mineral mines/quarries of the district are yet to be exhausted of their mineral content, reclamation measures have to be undertaken gap plantation of local species in the peripheral safety zones of the quarries/ clusters and in some of the haul roads.

27. CONCLUSION

The District Survey Report for *Sand (Minor Mineral)* in respect of Koraput District prepared in accordance with Appendix-X, Para-7(iii)(a) of S.O. 3611(E) dt. 25.07.2018 of Ministry of Environment, Forest and Climate Change, New Delhi, Enforcement & Monitoring Guideline for Sand Mining-2020 and in compliance with the orders of Hon'ble Supreme Court dt. 10.11.2021 in connection with C.A Nos. 3661-3662 of 2020. This report provides information on the development and planning of the district gathered from various government departments, i.e., Irrigation department, Forest department, Public works department, Revenue department, Water Resource department, ORSAC, and Mining department.

Koraput district in last few years has been a hotspot for overall developmental work to improve quality of living of southern Odisha people. Looking into the booming developmental works in Koraput and nearby districts, and to bridge the gap of demand and supply of minor minerals, for such developmental projects, utmost care has been taken up to prepared a compressive District Survey report for *Sand (Minor Mineral)* which will valid for next five years. The report endures an overview of the district's sufficient mineral resources, geological structure, environmental protection, ecological setup, community involvement, and regulatory compliance. Other measures include planning, monitoring of mined material and its transportation, and putting a stop to illegal mining and material sales. DSR will aid for revenue collection of the district as well as the state by means of carving out potential auctionable minor mineral sources in the district.

Details of Sand/M-Sand Sources

a) Rivers :

RIVER NAME/M-SAND PLANT	TOTAL STRETCH OF RIVER (IN KM)	TYPE OF RIVER (PERENNIAL OR NON-PERENNIAL)
KOLAB RIVER	125 KM	PERENNIAL RIVER
MACHHKUND RIVER	65 KM	PERENNIAL RIVER
TELENGIRI RIVER	48 KM	PERENNIAL RIVER
KUKUDA NALA	15 KM	PERENNIAL RIVER
INDRAVATI RIVER	264 KM	PERENNIAL RIVER
KURULU RIVER	45 KM	NON-PERENNIAL RIVER
CHAMPABATI/ JHANJABATI RIVER	52 KM	PERENNIAL RIVER

b) De-siltation Location: (Lakes/Ponds/Dams etc.)

NAME OF RESERVOIR/DAMS	MAINTAIN/CONTROLLED BY STATE GOVT./PSU ETC.	LOCATION	DISTRICT	TEHSIL	VILLAGE	SIZE (HA)
KOLAB RESERVOIR	ODISHA	KOLAB	KORAPUT	KORAPUT	-	10000 HA
JALAPUT RESERVOIR	ODISHA	MACHHKUND	KORAPUT	NANDAPUR	-	9712 HA
TELENGIRI RESERVOIR	ODISHA	RANIGADA	KORAPUT	JEYPORE		350 HA

c) Patta Lands/ Khatedari Land :

OWNER	SY. NO	AREA (HA)	DISTRICT	TEHSIL	VILLAGE	AGRICULTURE LAND (YES/NO)
NIL						

d) M-Sand Plants :

PLANT NAME	OWNER	DISTRICT	TEHSIL	VILLAGE	GEO-LOCATION	QUANTITY TONNES/ANNUM
NIL						

Note: For inclusion of M-Sand Plant/ Patta Land in DSR the plant/landowners need to submit the request to the Mining Department with complete details. Inclusion in DSR does not give them the right to operate the M-Sand Plant/Sand Mining lease.
